Address generation system for electronic mail - has address generation unit which produces electronic mail address using mail address generation rule for electronic mail system to which electronic mail is sent

NEC CORP 96.04.05 96JP-110185

T01 (97.10.21) I104L 12/54, G06F 13/00, I104L 12/58

The system has an input unit (110) which inputs an electronic mail address to which an electronic mail will be sent. An address database (121), stored in a memory device (120) and containing the names of electronic mail systems, is referenced when an electronic mail system to which the electronic mail will be sent is defined using a rule for identifying an electronic mail system.

The electronic mail address is produced by an address generation unit (133) using a mail address generation rule for the defined electronic mail system.

ADVANTAGE - Enables calling party to produce address of receiving electronic mail system that is different from transmitting electronic mail system without considering differences in address generation of different electronic mail systems. (5pp Dwg.No.1/4)
